

# System requirements

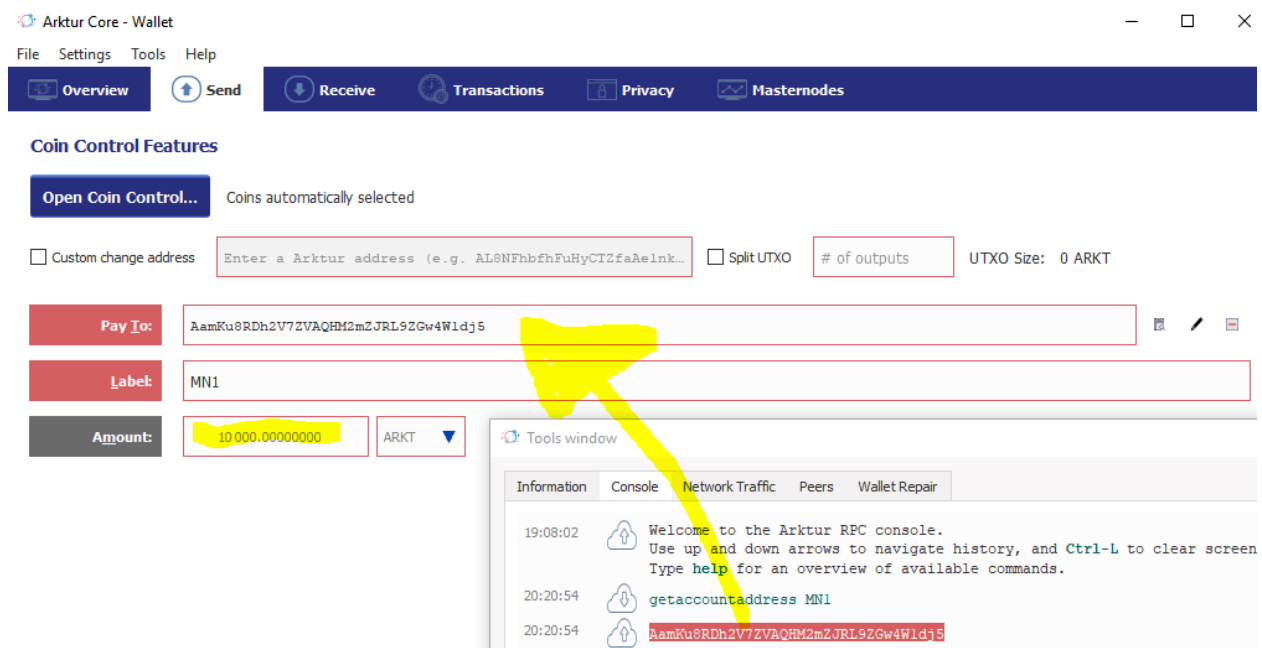

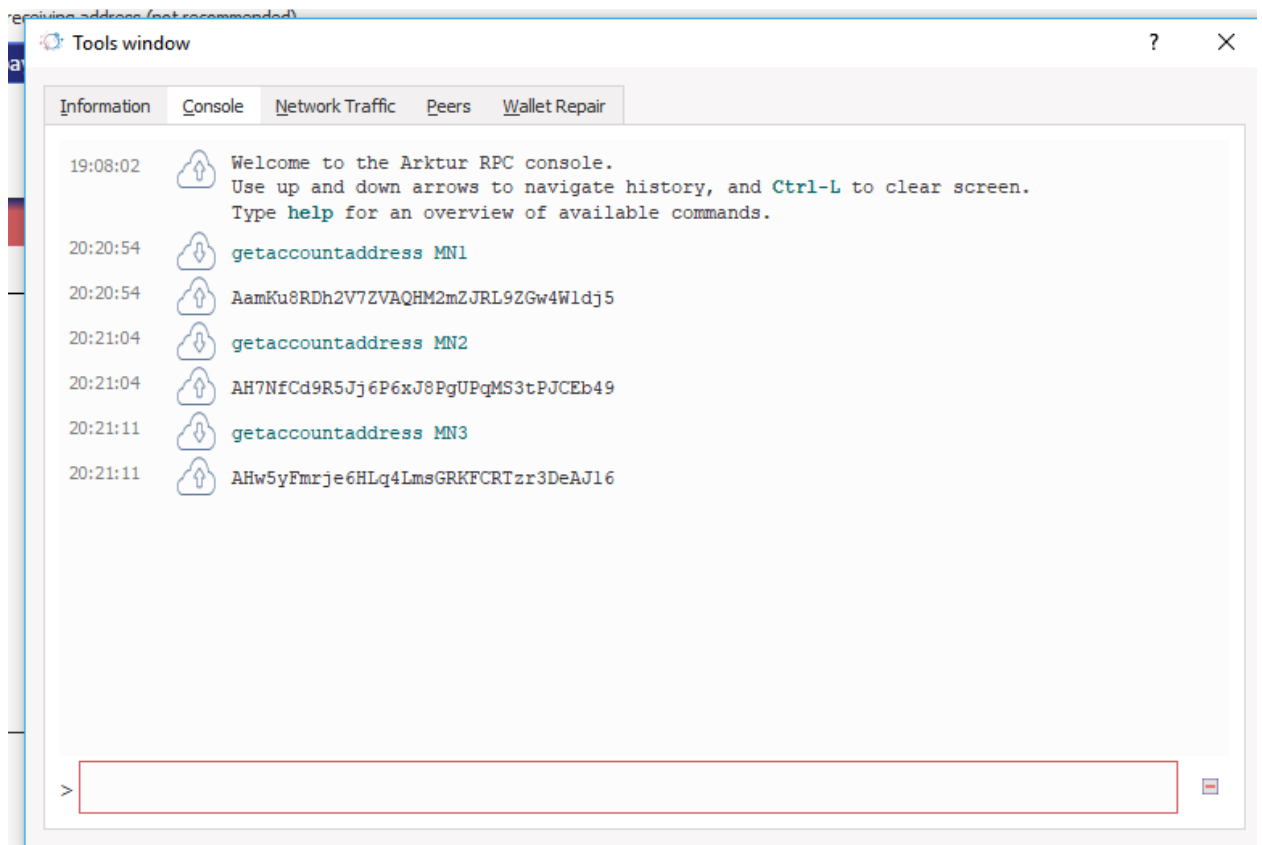

The VPS you plan to install your masternode on needs to have at least 1GB of RAM and 10GB of free disk space. We do not recommend using servers who do not meet those criteria, and your masternode will not be stable. We also recommend you do not use elastic cloud services like AWS or Google Cloud for your masternode - to use your node with such a service would require some networking knowledge and manual configuration. Better use Ubuntu 16.04

## Funding your Masternode

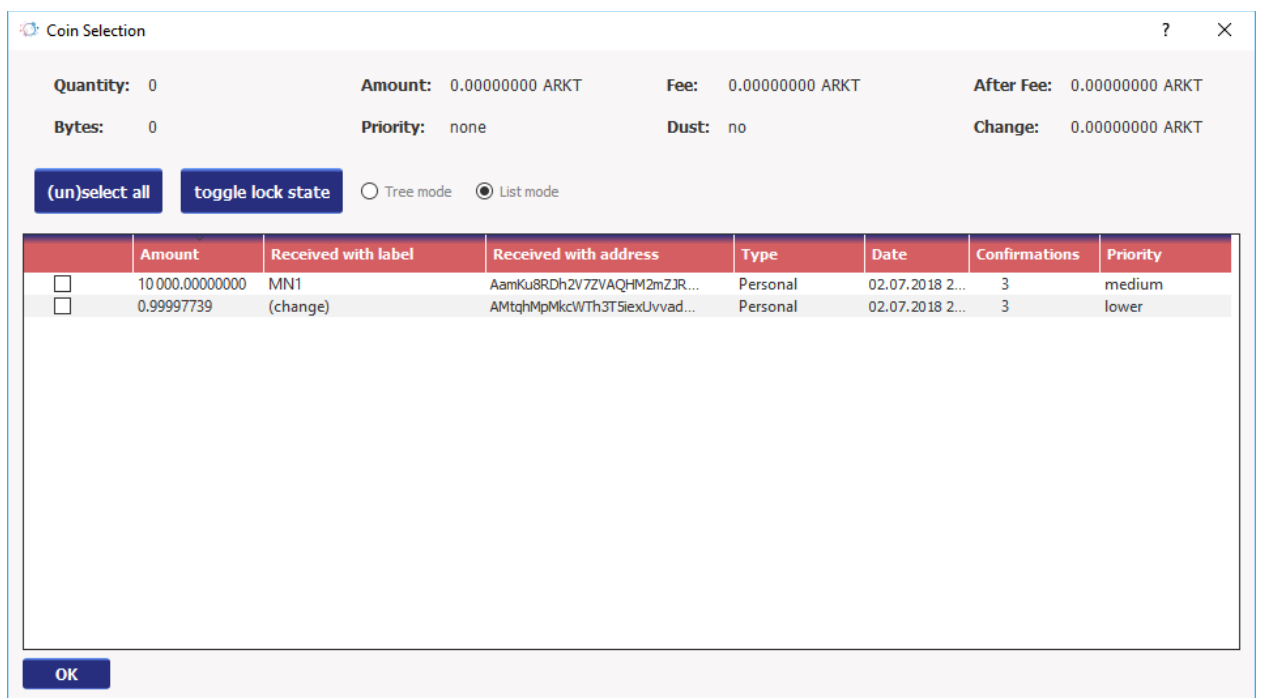

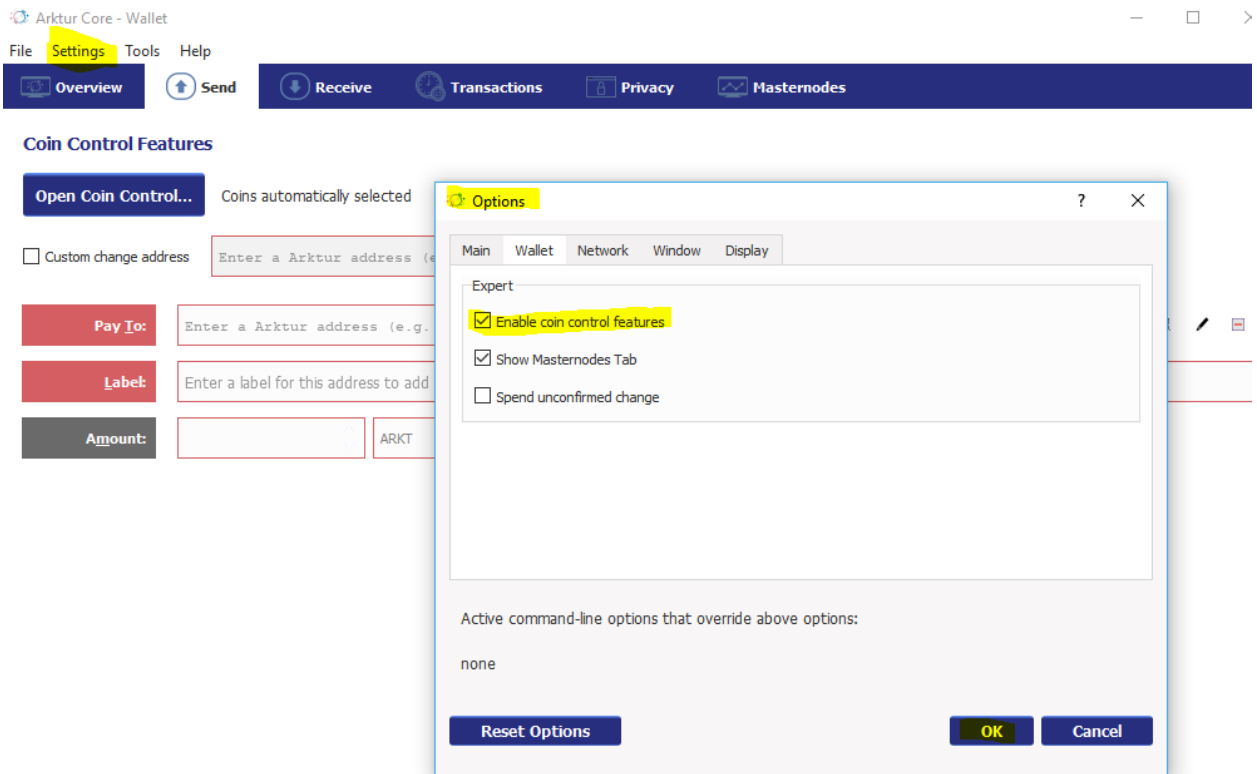

- First, we will do the initial collateral TX and send exactly 10000 ARKT to one of our addresses. To keep things sorted in case we setup more masternodes we will label the addresses we use.
- Open your Arktur wallet and open debug console.
- Type **getaccountaddress MN1**

- The generated address will now be labelled as MN1. If you want to setup more masternodes just repeat the steps so you end up with several addresses for the total number of nodes you wish to setup. Example: For 10 nodes you will need 10 addresses, label them all.

- Once all addresses are created send 10000 ARKT each to them. Ensure that you send exactly 10000.000 ARKT and do it in a single transaction. You can double check where the coins are coming from by checking it via coin control usually, that's not an issue. You need at least 1 confirm to see that.

As soon as all transactions are done, **will wait for 15 confirmations**. You can check this in your wallet or use the explorer. It should take around 30 minutes if all transaction have 15 confirmations.

# Installation & Setting up your Server

SSH (Putty on Windows, Terminal.app on macOS) to your VPS, login as root (**Please note:** It's normal that you don't see your password after typing or pasting it) and run the following command:

```
bash <( curl
https://raw.githubusercontent.com/mrkss21/arktur/master/install.sh )
```

```
root@26:~# bash <( curl https://raw.githubusercontent.com/mrkss21/arktur/master/install.sh )
```

If you get the error "bash: curl: command not found", run this first: `apt-get -y install curl`

After install done, you will see next:

```
Your Masternode IP address: 80.2...:40001
Masternode private key: 92VUrNXCL...Mc2icbDFfz

==###.1.###== You can use type below for masternode.conf in your wallet - just add your 'transaction ID' and index (0/1)

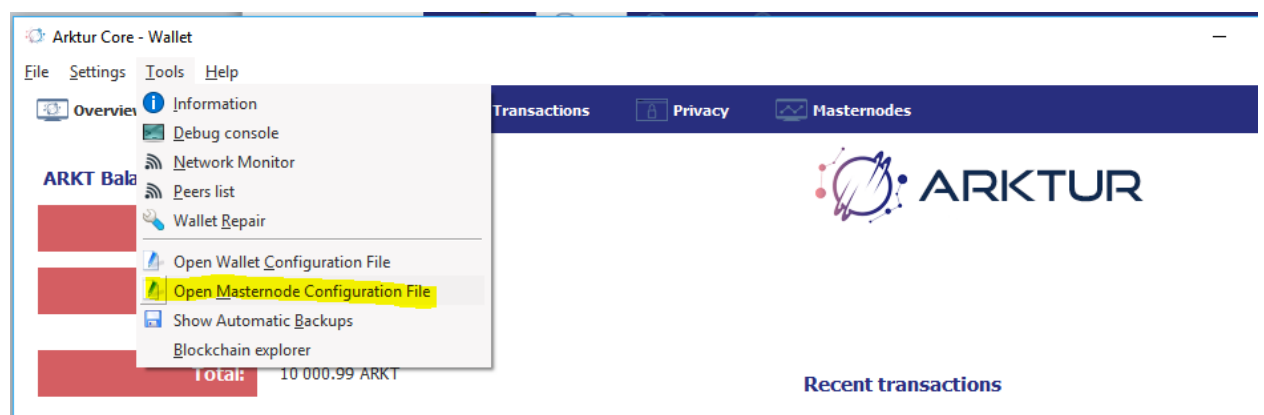

MN 80.2...:40001 92VUrNXCL...Mc2icbDFfz

==###.2.###== Just wait for 15 confirms of your 10000.00 ARKT transaction, make sure that wallet sync and block is like
arktur-cli getinfo | grep blocks

==###.3.###== Start node on wallet and check status with this command:
arktur-cli masternode status
root@26:~#
```

You have to copy Yellow line to masternode.conf file

Open Masternode configuration file in you wallet (you can find also this file here - `\%appdata%\arktur` in windows address line)

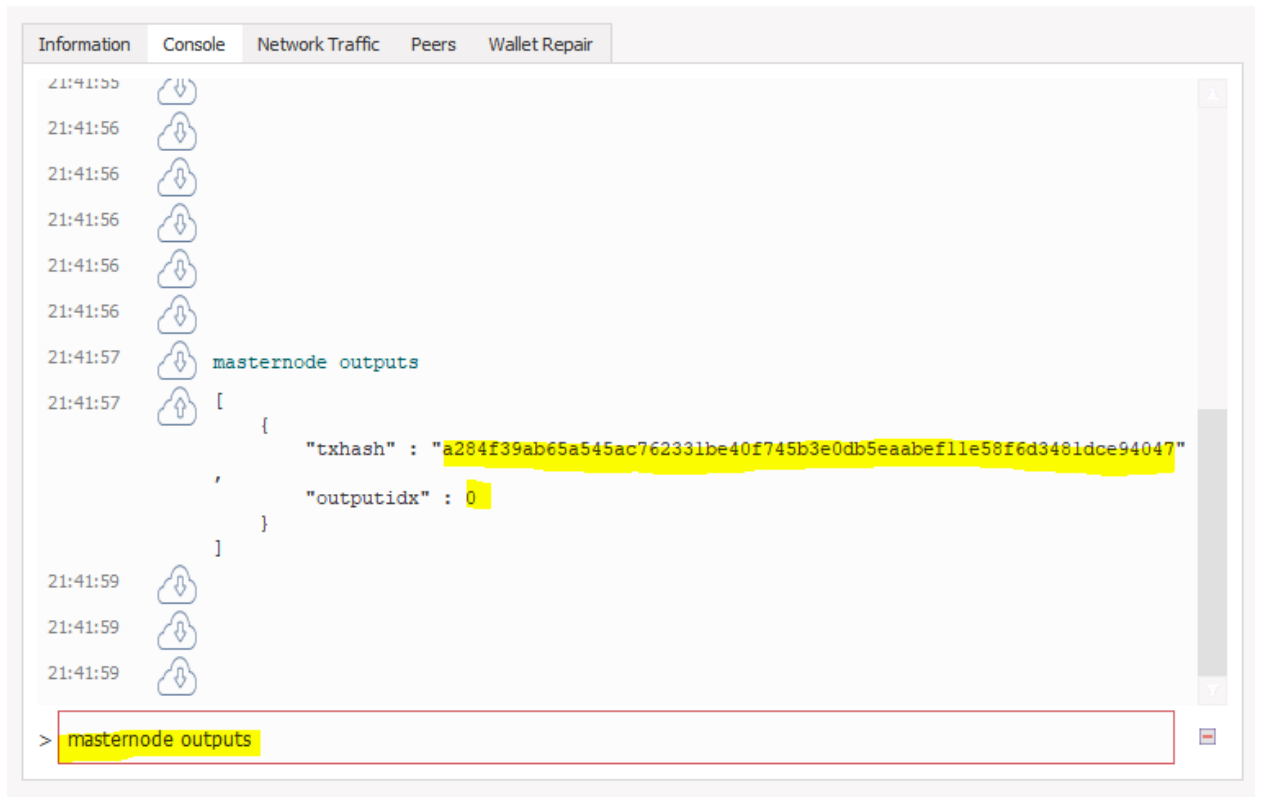

Now copy your yellow line to masternode.conf file

```
# Masternode config file
# Format: alias IP:port masternodeprivkey collateral_output_txid collateral_output_index
# Example: mnl 127.0.0.2:40001 93HaYBVUCYjEMeeH1Y4sBGLALQZElYc1K64xiqqX37tGBDQL8Xg 2bcd3c84
MN 82.120.10.2:40001 92GScFJBkFcBKBfrvghpD8ido7wYz2m6ZbJ7uX8qj2zW1b2casP
```

Run this command to get your output information in console:

```
masternode outputs
```

Add the output information to a conf file in single line.

```
# Masternode config file
# Format: alias IP:port masternodeprivkey collateral_output_txid collateral_output_index
# Example: mn1 127.0.0.2:40001 93HaYBVUCYjEMeeH1Y4sBGLALQ2E1Yc1K64xiqgX37tGBDQL8Xg 2bcd3c84c84f87eaa86e4e56834c92927a07f9e18718810b92e0d0324456a
MN 82.120.10.2:40001 92GScFJBkFcBKBfrvghpD8ido7wYz2m6ZbJ7uX8qjZzW1b2casP a284f39ab65a545ac762331be40f745b3e0db5eaabef11e58f6d3481dce94047 0
```

An example would be

```
Masternodename ipaddress:40001 genkey txhash outputidx
```

```
MN 82.120.10.2:40001 92GScFJBkFcBKBfrvghpD8ido7wYz2m6ZbJ7uX8qjZzW1b2casP
a284f39ab65a545ac762331be40f745b3e0db5eaabef11e58f6d3481dce94047 0
```

*masternodename* is a name you choose, *ipaddress* is the public IP of your VPS, *masternodeprivatekey* is the output from *masternode genkey*, and *txhash* & *outputidx* come from *masternode outputs*. Please note that *masternodename* must not contain any spaces, and should not contain any special characters.

## Restart and unlock your wallet.

Go to VPS now.

Make sure that wallet sync and block is like in explorer. Use this command to check:

```
arktur-cli getinfo | grep blocks
```

```
arktur-cli getinfo | grep blocks
--###.3.###-- Start node on wallet and check status with this command:
arktur-cli masternode status
root@26:~# arktur-cli getinfo | grep blocks
    "blocks" : 16817,
root@26:~# arktur-cli getinfo | grep blocks
    "blocks" : 19157,
root@26:~#
```

you can check actual block in <http://explorer.arktur.cc/>

The screenshot shows the Arktur Explorer website. The top navigation bar includes links for Arktur, Explorer, Movement, Network, Top 100, API, and MN-ROI. The main content area displays the network status, showing a network hash rate of 982689.5739 MH/s. Below this, there is a search bar with the placeholder text "You may enter a block height, block". The "Latest Transactions" section is visible, showing a table with columns for Block and Transaction ID. The first transaction is highlighted with a yellow circle, showing block 19158 and transaction ID d34ec4704a3ed71759.

Block	Transaction ID
19158	d34ec4704a3ed71759
19157	36899b584d1a16dec2
19157	b9625512b2982011c5f

Now you can start your masternode (hope you didn't forget restart wallet)

Overview Send Receive Transactions Privacy Masternodes

Note: Status of your masternodes in local wallet can potentially be slightly incorrect. Always wait for wallet to sync additional data and then double check from another node if your node should be running but you still see "MISSING" in "Status" field.

Alias	Address	Protocol	Status	Active	Last Seen (UTC)	Pubkey
MN	80[REDACTED]40001	-1	MISSING	00m:00s	1970-01-01 00:00	

Confirm masternode start

Are you sure you want to start masternode MN?

Yes Cancel

Start alias Start all Start MISSING Update status Status will be updated automatically in (sec): 2

ARKT

Arkturn-Qt

Alias: MN  
Successfully started masternode.

OK

File Settings Tools Help

Overview Send Receive Transactions Privacy Masternodes

Note: Status of your masternodes in local wallet can potentially be slightly incorrect. Always wait for wallet to sync additional data and then double check from another node if your node should be running but you still see "MISSING" in "Status" field.

Alias	Address	Protocol	Status	Active	Last Seen (UTC)	Pubkey
MN	80[REDACTED]40001	70005	ENABLED	00m:00s	2018-07-02 19:12	A[Ku8PDn3VtEwRQwMmSURL

Go to VPS and check status with this command:

arktur-cli masternode status

```
root@26:~# arktur-cli getinfo | grep blocks
  "blocks" : 19157,
root@26:~# arktur-cli masternode status
{
  "txhash" : "a284[REDACTED]e94047",
  "outputidx" : 0,
  "netaddr" : "80.[REDACTED]0001",
  "addr" : "Aa[REDACTED]dj5",
  "status" : 4,
  "message" : "Masternode successfully started"
}
root@26:~#
```

**Congratulations!**
